

# Melbourne Haskell Workshop 2013

## DRAFT COPY

- 6 Hours (Plus Lunch)
- Maximum attendance - 30 people (Including Volunteers)

[\(HTML\)](#)

A 6-hour workshop intended to introduce and provide resources for working with Haskell.

This workshop is based around a central concept of domain modeling with Haskell.

### **Note:**

If you are attending the workshop, please attempt to have the required items from the ‘Resources’ section available for your use.

## Table of Contents

---

|                              |                                     |
|------------------------------|-------------------------------------|
| <a href="#">Readme</a>       | Read this First                     |
| <a href="#">Resources</a>    | Resources Available                 |
| <a href="#">Introduction</a> | Motivation, Overview, and Approach  |
| <a href="#">Setup</a>        | Setting up your Haskell environment |
| Opening Exercises            | Introductory Exercises              |
| ADTs                         | Modelling with data in Haskell      |
| Typeclasses                  | Code-Reuse and Laws                 |
| Wildcard                     | Music                               |
| Monads                       | DSLs, IO, Do-Notation               |
| Ecosystem                    | Resources and Community             |

---

## Required Resources

Before you begin you will require the following...

### A Text-Editor

We are assuming previous programming experience, however, if you would like a recommendation, have a look at [Notepad++](#), [Sublime Text](#), or the ever-popular [Emacs](#) and [Vim](#). Just make sure that you are fluent enough to embark on exercises as they appear in the workshop.

### The Haskell Platform

In order to run the programs written during this workshop you will need a Haskell installation. The easiest way to get up and running is to install the latest Haskell Platform. This is a “batteries included” installation of GHC and Cabal that includes many of the most useful packages available in the Hackage ecosystem.

### A Copy of the Workshop Scaffold Project

[https://github.com/sordina/haskell\\_workshop](https://github.com/sordina/haskell_workshop)

Either clone with git:

```
git clone https://github.com/sordina/haskell_workshop.git
```

... or [download the zip](#) from GitHub.

## Useful Resources

These resources are available to help you with any issues you face when learning Haskell:

### #haskell on [Freenode](#)

An IRC channel dedicated to discussion of Haskell. This is often the easiest place to fire off a one-off question that is simple enough not to warrant a permanent listing on the internet.

### [Hackage](#)

Hackage is the primary repository for Haskell packages. It is public, searchable, versioned, and uses Cabal package metadata for classification. Furthermore, this can be used to easily browse package contents, documentation and source-code.

For example, browse the [Shake](#) package and look at some of the [Modules](#).

## Hoogle

Hoogle is a Haskell module and function search-engine. Hoogle allows you to take advantage of the granular type-system used by Haskell to search not just for function-names, but for function type-signatures.

For example, have a look for the function with signature [Text -> ByteString](#).

## MFUG

MFUG is the Melbourne Functional Programmer's User Group. This group discusses many topics, including Haskell.

## [/r/haskell](#)

For Reddit users, [/r/haskell](#) is a very useful resource with a great deal of information regarding recent developments in the Haskell ecosystem and community. This is a good place to ask some more advanced questions or start a flame-war.

## Haskell News

Haskell News is a firehose-style haskell news aggregator taking information from sources as varied as academic-journals, and GitHub accounts.

## HLint

HLint is a [linting tool](#) for Haskell source - It can often provide some useful hints about refactoring avenues for your code.

---

# Introduction

Welcome to the Melbourne Haskell Workshop 2013.

This intent of this workshop is to provide a working introduction to Haskell for programmers in Melbourne who have not yet used the language in anger.

---

## Setup

### ... and Sanity Checking

Ensure that you have the following programs installed and functioning correctly:

- GHC(i)

At a command prompt, enter the following command:

```
ghci
```

This should launch the GHC Haskell REPL.

Type the following to ensure that you have a functioning REPL:

```
1 + 1
```

This should yield the result:

```
2
```

Create the following source file (program.hs):

```
main = print "hello world"
```

Compile the program as follows:

```
ghc --make program.hs
```

Run the program with the following command:

```
./program
```

The output should look as follows:

```
"hello world"
```

## Cabal

You should have access to a Cabal installation if you have installed the Haskell Platform.

Check that you have cabal by running:

```
cabal --version
```

This should output something similar to:

```
cabal-install version 1.16.0.2
using version 1.16.0 of the Cabal library
```
